# Climate Change and Health

## How climate change impacts our environment

Climate change is one of the greatest threats to our health

Temperatures are expected to rise by 2.8-3°C in the Loddon Mallee region by 2050

Pollution contaminates air, water and soil

Greater risk and frequency of extreme weather events - bushfires, storms and floods

Changes in temperature and rainfall patterns affect agricultural productivity and food security

Extreme weather events can lead to changes in quality of water sources

## How climate change impacts our health

Worsening air quality leads to breathing problems

Severe weather events can lead to injury and loss of life

Increased anxiety and trauma due to extreme weather events, displacement and concerns about the future

Air pollution and extreme weather events can increase the risk of heart attacks and strokes

Floods can cause mosquito outbreaks which can spread diseases like Ross River Virus

Decreased water and food quality can cause gastrointestinal infections

## How climate change action is good for our health

Taking public transport means less pollution, less road congestion and cleaner air

Buying or growing local produce reduces carbon miles and increases access to affordable and fresh plant-based food

Green spaces foster community connection, mental wellbeing and reduce heat stress

Riding a bike means less cars on the road, less pollution and more exercise which improves cardiovascular health

Waste management conserves resources and minimises landfill waste which improves air, water and soil quality

Energy efficient buildings reduce emissions and protect people from extreme weather for less cost
